

```
public final class CacheManagerBoot extends BootJob {

    @Override
    protected void start() {
        CacheManagerFactory.create().init();
        startNext();
    }

    @Override
    protected void stop() {
        stopNext();
        CacheManagerFactory.create().destroy();
    }
}
```

Choose Implementation of init (2 found)

FileCacheManger	(com.mpush.test.spi)	mpush-test
RedisManager	(com.mpush.cache.redis.manager)	mpush-cache

1、通过SPI，找到mpush-cache模块中CacheManagerFactory接口的实现类RedisCacheManagerFactory，得到RedisManager实例；

2、初始化jedis连接对象

```
RedisManager init()

public final class RedisManager implements CacheManager {
    public static final RedisManager I = new RedisManager();

    private final RedisConnectionFactory factory = new RedisConnectionFactory();

    public void init() {
        Logs.CACHE.info("begin init redis...");
        factory.setPassword(CC.mp.redis.password);
        factory.setPoolConfig(CC.mp.redis.getPoolConfig(JedisPoolConfig.class));
        factory.setRedisServers(CC.mp.redis.nodes);
        factory.setCluster(CC.mp.redis.isCluster());
        if (CC.mp.redis.isSentinel()) {
            factory.setSentinelMaster(CC.mp.redis.sentinelMaster);
        }
        factory.init();
        test();
        Logs.CACHE.info("init redis success...");
    }
}
```

3、调用startNext继续调用下一个BootChain
