入站顺序: decoder -> handler 出站顺序: handler -> encoder

```
NettyTCPClient initPipeline()

protected void initPipeline(ChannelPipeline pipeline) {
    pipeline.addLast("decoder", getDecoder());in
    pipeline.addLast("encoder", getEncoder());out
    pipeline.addLast("handler", getChannelHandler());
    }
    in

protected ChannelHandler getDecoder() {
    return new PacketDecoder();
}

protected ChannelHandler getEncoder() {
    return PacketEncoder.INSTANCE;
}
```

## 解码

PacketDecoder extends ByteToMessageDecoder ByteToMessageDecoder extends ChannelInboundHandlerAdapter

## 编码

PacketEncoder extends MessageToByteEncoder<Packet>
MessageToByteEncoder<I> extends ChannelOutboundHandlerAdapter
主要是MessageToByteEncoder类中的write方法回调子类PacketEncoder中的encode方法;
